01

Executive Summary

Executive Summary

The Problem

~50% of academic deadlines are hidden in unstructured documents (PDFs, Word, HTML) and missing from Moodle.

The Impact

Fragmented information leads to missed submissions and administrative overhead.

The Solution

A Generative AI-powered tool that converts unstructured course materials into structured, actionable calendar events.

The Promise

Privacy-conscious, stateless processing with zero required system-level integration.

02

Use Case

The User Journey: From Chaos to Clarity

As-Is

1. Lecturer uploads semester program
2. Student searches for deadlines
3. Manual calendar entry
4. High risk of errors

A manual consolidation across Moodle, SharePoint, and syllabuses. Highly error-prone and time-consuming.

To-Be

1. Input: Upload document or paste raw text.
2. Extract: AI identifies and normalizes dates, times, and tasks.
3. Validate: Human-in-the-loop review.
4. Export: Download standardized .ics file to personal calendar.

03

Business Value & Impact

Delivering Measurable Impact

For Students

- Enhanced planning reliability.
- Direct reduction in missed or late submissions.

For Administration

- Process standardization.
- Fewer deadline-related clarification emails.

Return on Investment (ROI)

Avoiding even a single missed submission per student per semester justifies adoption.

04

Architecture Overview

Engineered for Privacy and Precision

Stateless Processing: No persistent user database; temporary job storage only.

Data Privacy: Documents remain user-owned and are discarded after processing.

Tech Stack:

- Multi-format document parsers.
- Generative AI for contextual extraction.
- Strict JSON schema validation.
- RFC 5545 standard for cross-platform .ics export.

Learnings

Key Takeaways & Future Outlook

- Prompt Engineering
- Data Quality
- Human-in-the-loop
- Fast Learning Loops
- Version Control
- ...
